To support all students developing system design …

Learning from team work – presentation

Prof. Jigar Pandya • Jan 18

⋮

-Good to have few screen/with speech recorded to be ready to convey concept.
-Maintenance i.e. sharing wsdl for service to client. Provide with proper version link and reference to support future changes.
- SVDD - software version description document
- Profanity filter is must as and when applicable.
- Identify best of all.from features (technical) via assigning priority value and sorting as and when needed. Team of size 1,2,3 will have respectively 5-7 minutes ,7-10 minutes and 10-15 minutes max for viva/demo/presentation during exam.
- Business rules are driving the data quality. Also, based on version of the feature/s rules might vary and its a crucial thing. I have seen developer positions for only developing rules and enforcing via some framework. i.e. ilog jrule builder now with ibm.
- Testing for mobile apps have a lot more scope as various mobile os and differnt codebase. I am aware of a company which has physical 500+ devices and a framework developed to support clients test their app development on different devices.
- If supporting search, make sure to show filters as tiles. may be with x button to discard one at at time and refresh the page.
- Push changes to git is a must to do regularly.
